

The header will contain an image which will be the company logo which will be a link back to the index page. It will sit on the coloured strip in the top left. A second smaller logo will replace the main one when the screen reaches a small certain width.

Font for links will be: arial, san-serif or vendona. More than one font is where a device might not have the font installed. The font size will be 1.3em. A tab index will be added to all links starting from top of page to the bottom link on the page.

All text excluding links will be 16px and will use either: arial, san-serif or vendona. The text colour will be black on contrast itself against a white background.

All links on the navigation bar and links, main header (h1) and table caption will have the underline removed. All links will be black but the main body links will be kept at default but will also have the underlined kept. The links will be 1.3em. They will also have a mouse over text as well. With a hand cursor used instead of an arrow. Accesskeys will be applied to all links starting with 1 to 10 then z, y, x, ...

Images will be responsive web design so when the screen width decreases the main images width and height decreases as well. This will also be used on the small logo but not the large logo since it gets replaced. The images will have a copy of them self because when the screen reaches a certain width will stop resizing to stop them becoming too small.

Footer will contain contact information such as a fake phone number and E-mail address. It Will also reference any webpages where images are used from official companies. The link for the e-mail address will again link back to the homepage and will be white for contrast since the footer will have a background colour that matches the header.

A horizontal navigation bar will be used instead of a vertical one because they will be more noticeable compared to down the right-hand side of the page. All links except wireframe will be inked to the homepage. There will be spaces so the page is more “touch friendly” on devices. The Navigation bar height will increase when the width of the screen decreases because the links that would disappear if the screen goes too small will go on a new row instead.

Will be a link to events page in same style as navigation bar. Table caption and reviews will be 1.3em. The right column wrapper with the table and reviews will disappear when they screen size is reduced. This is mainly because the side information is not as relevant as the main body. Table cells will have a border around for clarity. It will also have a space left and right so it not touching a border around the table.

When the screen is a small width (around phone size) the text information will be undeath the images. Where on PC, laptop screens the text will be to the right of the images.

All images, links and the logo will have a text label which will appear when the user hovers the mouse over them. This is to improve accessibility to wider range of visitors.

1em = 16px.

The navigation bar will be blue to contrast itself from the background and the logos used will have a red background.
